Epic 5 Gold Scoring & Repository

Pre-computed governance scores: column, table, KPI, gaps stored in the Gold Delta layer

ID	User Story	Acceptance Criteria	Pts	Tags / Components
US-5.1	<i>As a data engineer,</i> I want to see which columns failed governance checks and why, <i>so that I can fix data quality issues before they reach downstream consumers.</i>	- Given a pipeline run, each column in column_governance shows pass/fail status - Failed columns include the specific check name and failure reason - Results are queryable via Unity Catalog within 10 min of pipeline completion - Failures do not block Silver → Gold promotion; they are flagged, not dropped	5	- column_governance - governance_gaps - Silver → Gold - Delta Live Tables
US-5.2	<i>As a governance officer,</i> I want a single governance score per table updated on each pipeline run, <i>so that I can track compliance trends across the estate without manually auditing tables.</i>	- table_governance stores a composite score (0–100) per table per run - Score is computed from all 11 rubric checks in config/rubric.yaml - Historical scores are retained so trend analysis is possible over time - kpi_summary aggregates scores by domain / owner	5	- table_governance - kpi_summary - config/rubric.yaml - Gold layer
US-5.3	<i>As a data steward,</i> I want to see a structural profile of each table nullability, type distribution, row count,	- table_structure_profile exists for every Gold table after each run - Profile includes: row count, null % per column, distinct count, min/max values	3	- table_structure_profile - Gold layer - Databricks App - Unity Catalog

ID	User Story	Acceptance Criteria	Pts	Tags / Components
	<i>so that I can certify assets with confidence and flag anomalies before certification.</i>	- Profile is surfaced in the Databricks App steward workflow view - Anomaly threshold breaches (e.g., null% > 20%) are highlighted automatically		

Epic 6 Genie Chatbot

Natural-language query over governed Gold tables via dg_poc_genie space

ID	User Story	Acceptance Criteria	Pts	Tags / Components
US-6.1	<i>As a business analyst,</i> I want to ask plain-English questions about data quality KPIs and get instant SQL-backed answers, <i>so that I can answer stakeholder questions without waiting for an engineer to write a query.</i>	- Genie returns a result for any question scoped to approved Gold tables - The underlying SQL query is visible alongside the answer - Response time is under 15 seconds for standard KPI questions - Genie gracefully declines questions outside its configured table scope	5	- Genie UI (Obj 1) - dg_poc_genie - trusted SQL - Natural language
US-6.2	<i>As a governance officer,</i> I want Genie to only answer questions about tables I have approved in its scope, <i>so that sensitive or uncertified datasets are never accidentally exposed through conversation.</i>	- Genie Space is configured with an explicit table scope list (no wildcard access) - Queries referencing out-of-scope tables return a clear refusal message - Scope changes require a privileged admin action (not end-user configurable) - Unity Catalog permissions enforce access at query time, not just at config time	3	- table scope - trusted SQL - Unity Catalog - Genie Space config

ID	User Story	Acceptance Criteria	Pts	Tags / Components
US-6.3	<i>As a data steward,</i> I want to flag a Genie answer as incorrect and leave a correction note, <i>so that the team can refine the scoring rubric and improve answer quality over time.</i>	• Every Genie response includes a thumbs-up / thumbs-down feedback control • Negative feedback opens a free-text note field for correction details • Feedback is captured via Conversation API and stored in a feedback Delta table • Records include: question, answer, SQL, user, timestamp, correction note	5	• Conversation API • Feedback capture • rubric refinement

Epic 7 Dashboard / BI

AI/BI Dashboard — KPIs, completeness, cert mix, PII coverage, DQ%, trends (Objective 2 – Shareholders)

ID	User Story	Acceptance Criteria	Pts	Tags / Components
US-7.1	<i>As a executive sponsor,</i> I want a one-page view of overall data quality and certification rates across all domains, <i>so that I can report programme health to the board without requiring analyst support.</i>	• Dashboard loads within 5 seconds and requires no technical training to interpret • Top-level KPIs visible without scrolling: DQ%, Cert Mix, Completeness, PII coverage • Each KPI shows current value and trend vs. prior period • Dashboard is exportable as PDF for board presentations	5	• AI/BI Dashboard • KPIs • DQ% • Cert Mix • Databricks SQL
US-7.2	<i>As a governance officer,</i> I want to see PII coverage and completeness trends over time on a single dashboard, <i>so that I can demonstrate continuous improvement to regulatory stakeholders and auditors.</i>	• Trend charts show daily / weekly / monthly data for at least the past 90 days • PII coverage % is broken down by domain and data classification level	5	• PII Coverage • Completeness • Trends • Regulatory • Databricks SQL

ID	User Story	Acceptance Criteria	Pts	Tags / Components
		- Completeness metric is computed per table and rolled up to domain level - Data lineage back to source system is accessible from the dashboard		
US-7.3	<i>As a data engineer,</i> I want the dashboard to refresh automatically after each pipeline run, <i>so that I can trust that what I am seeing reflects today's data without manual intervention.</i>	- Dashboard queries auto-refresh on a schedule aligned to pipeline cadence - A 'last refreshed' timestamp is visible on every dashboard page - Stale data (older than 2x the refresh interval) triggers a visible warning banner - No manual query execution or page reload is required to see current data	3	- Databricks SQL - Auto-refresh - Pipeline integration - Delta Live Tables

Epic 8 App & AI Ops

Databricks App — steward workflow, score drill-in, AI suggested fixes, embedded chat, feedback capture

ID	User Story	Acceptance Criteria	Pts	Tags / Components
US-8.1	<i>As a data steward,</i> I want the app to surface AI-suggested fixes for failing governance checks alongside the score, <i>so that I can resolve issues in one place instead of switching between tools.</i>	- Each failed check in the steward view includes at least one suggested remediation action - Suggestions are generated by the AI model based on check type and column metadata - Stewards can accept, dismiss, or edit a suggestion before applying it - Applied suggestions are logged with the steward's identity and timestamp	8	- Suggested fixes - Scores + Drill-in - Databricks App - AI Ops

ID	User Story	Acceptance Criteria	Pts	Tags / Components
US-8.2	<i>As a data steward,</i> I want to chat with Genie directly inside the app while reviewing a table's score, <i>so that I can ask contextual follow-up questions without losing my place in the steward workflow.</i>	• An embedded chat panel is available on the table detail view within the App • Chat is pre-scoped to the table currently under review • Conversation context persists for the duration of the review session • Stewards can copy a conversation excerpt into a steward note	8	• Embedded chat • Conversation API • Genie Space • Steward workflow
US-8.3	<i>As a governance officer,</i> I want all steward actions and AI suggestions to be logged with timestamps and user attribution, <i>so that we have an auditable record of every governance decision made through the platform.</i>	• Every steward action (accept, dismiss, edit, certify) is written to an audit Delta table • Log entries include: user, action type, table/column, timestamp, AI suggestion reference • Audit log is queryable via Unity Catalog with read-only access for governance officers • Audit data is retained for a minimum of 12 months	5	• Feedback capture • Steward workflow • Audit log • Unity Catalog • Compliance

Summary: Story Points by Epic

Epic	Name	Stories	Total Points	
Epic 5	Gold Scoring & Repository	3	13 pts	
Epic 6	Genie Chatbot	3	13 pts	
Epic 7	Dashboard / BI	3	13 pts	
Epic 8	App & AI Ops	3	21 pts
